Building lime innovation

Masonry Mortars

The durability of buildings largely depends on their capacity to withstand deformation.

In masonry, deformation is mainly linked to the characteristics of the mortar that need to combine compatible compressive strength and long term elasticity.

Lime provides a way to achieve these characteristics but, furthermore, a way to maintain them.

Lhoist produces various types of lime that allow the manufacture of a variety of mortars that are suitable for all types of brick and block construction.

The formulated Tradical® PF binders are specially designed to provide simplified technical solutions:

- > a product range that provides adapted mortars for every type of brick, block and masonry
- > low energy binder products that have true vapour permeability and long term durability
- > the excellent workability of lime-based mortars enables efficient construction practices to be used
- > a natural pot-life that minimises waste and permits working flexibility
- > high quality airlime combined with carefully selected hydraulic and puzzolanitic components
- > the simplicity and effectiveness of mortar mix designs
- > assured performance.
