

Plaster/render on clay brick/ quarry stones construction

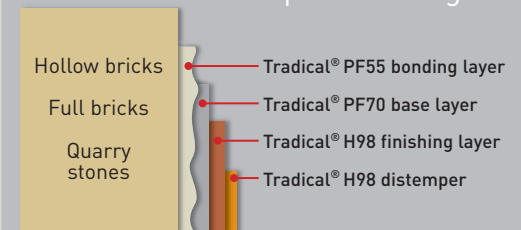

Clay bricks are a porous and vapour permeable material. To keep these characteristics and to provide a good hydrothermal comfort, materials that provide the same properties should be used with them.

Lime plasters/renders comply with this requirement. They also provide the possibility to have an important thickness that is often necessary on this type of substrate.

Work with a render/plaster finishing

Work with a distemper finishing

Total thickness of the render/plaster : 20 mm (DTU 26.1)
