

## Render/plaster for soft substrate

The soft substrates such as chalk, aircrete and hempcrete have a very important vapour permeability. It's precisely this characteristic that provides their hydrothermal properties.

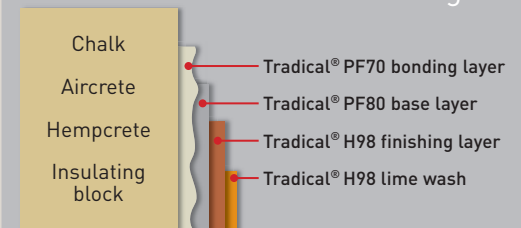

The porosity of lime based render/plaster is the ideal combination with these substrates in order avoid vapour barriers

In addition, due to the elasticity of lime-based products, Tradical® plasters/renders will withstand the thermal shocks that can occur due to the strong thermal resistance of the substrates.

### Work with a render/plaster finishing

### Work with a lime wash finishing

Total thickness of the render/plaster : 20 mm (DTU 26.1)
